

Discussion of “Fiscal Dominance, Monetary Policy and Exchange Rates: Lessons from Early-Modern Venice”

François R. Velde

Monetary and Financial History: Lessons for the 21st Century — Nov 2024

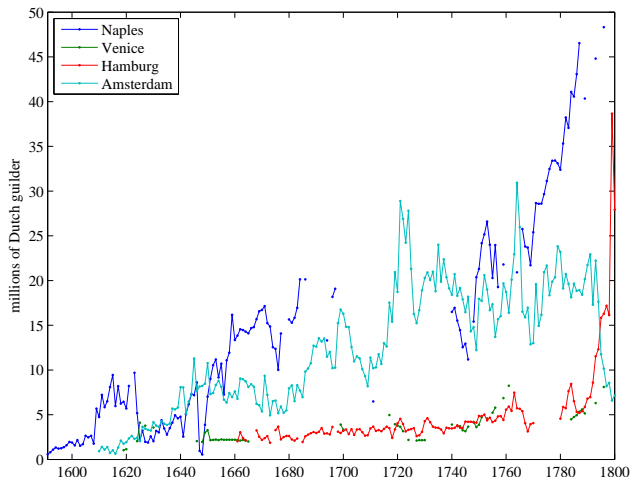

- ▶ Venetian ducat an international currency
- ▶ its FX value affected by government's fiscal stance
 - ▶ deficit monetization reduced its value, stricter stance increased it
 - ▶ first episode (1630) had less impact than second episode (1648–50)
- ▶ choice of convertibility had limited impact on its value

- ▶ banks
 - ▶ Giro was one of several public banks
 - ▶ motivations: provide a safe and stable asset in a context of fragile private banks and low-quality coinage
 - ▶ pre-existing ones (including Venice's Rialto bank) were deposit banks
 - ▶ Giro was different: it turned unsecured government debt into a liquid asset
 - ▶ value propped up by discretionary redemptions (but in what?)
- ▶ markets
 - ▶ foreign exchange markets where bills were traded
 - ▶ bills on/from Venice quoted in *valuta di banco* from 1593 (before the Giro)

- ▶ coins
 - ▶ gold: ducato d'oro or zecchino (24c since 1252), scudo d'oro (22c since 1528)
 - ▶ large/fine silver: ducato d'argento (from 1561), scudo veneto (from 1578)
 - ▶ small/billon silver: *grossa da 20*, *grossa da 12*, *minuta*
- ▶ units of account
 - ▶ *lira di piccoli* (L, tied to small silver coins)
 - ▶ *lira di grossi* (originally tied to large silver coins, then fixed at L62)
 - ▶ *ducato d'oro* (originally tied to gold coin, then fixed at L6.2) or *ducato corrente*
 - ▶ *moneta di zecca* (originally tied to the large silver coins)
 - ▶ *ducato di banco* (originally tied to *moneta di zecca*, then to *moneta corrente*)
- ▶ in what sense is the one ducato that is an international currency?
- ▶ how to measure the value of the *ducato di banco*?
 - ▶ ideally the agio, but there are too few quotations
 - ▶ alternative: foreign exchange rates (from listini)

Exchange rates

- ▶ empirical method: regress change in exchange rate on stock
- ▶ one can also look at real balances

Real Balances

- ▶ familiar pattern from later episodes (British Suspension, greenbacks)
- ▶ most of the time, nominal balances around D800,000
 - ▶ considered the prudent level
 - ▶ two major exceptions (and only two): plague of 1630, Turkish War of 1648–50
 - ▶ different effect: time trend or just different shocks?
 - ▶ wars much more open-ended

- ▶ “fiscal dominance”: is that the right framework (only one authority here)
- ▶ Giro episode one of many in centuries-long process of learning how to manage a currency
- ▶ particularly interesting because it's one of the first
 - ▶ but Venice had done something similar with copper coinage in its colonies in 15th c
- ▶ clearly Venice had learned how to manage it, by staying on a small scale
 - ▶ not that convertibility doesn't matter, but it can be mimicked
- ▶ lingering questions
 - ▶ why the D800,000 ceiling?
 - ▶ why did merchants insist on convertibility in 1666?
 - ▶ more details on the fiscal stance?
